

Adobe CQ Help / How to use Conditions in Workflow Launcher

Problem

You want to know how conditions work in the *WF Launcher* and what conditions are possible.

Resolution

The *WF Launcher* condition is used as filter to decide if the configured workflow has to be started or not.

Only simple equal functionality is implemented at the moment, for example

`cq:template==/apps/geometrix/templates/contentpage.`

The syntax is very simple: `property == value.`

It's only one condition per *WF Launcher* possible and you can check for every property of a node for which the configured event occurred.

The workflow is started only if the condition syntax is correct (see above), there is a corresponding property available in the node the event was triggered for and the configured value is equal to the value of the property in this node.
